

Out of all the different aspects you mentioned in that first part, I want you to pick the top 15 that are most important in making a student's decision, like what a student values most when picking their university.

I want to get the data using an API from an AI model such as ones I already have (chatgpt, claude) to look up data across the internet to put it all together to make everything possible (web scraping). I also want you to pick what is most important when creating the matching algorithm.

Look up what students value most to create what you think is best for each aspect to be weighted. Ask the questions that are weighted more at the beginning. Users can input some preferences into what they want on the questions. For example, on each of the questions, they can input a nice to have range such as "Great - certain amount-range", "Alright - certain amount-range", "Bad - certain amount-range", and etc. For example, for the student budget per year budget, "Great - 10000-25000", "Alright: 25000-40000", "Bad: 40000-60000", and etc. I want to handle the tradeoffs based on their ranking of everything. I would like you to decide what is best for that.

This is going to be a conversation and it is not going to be all at once. The user can go back and change answers. There is a progress indicator. Yes, save results for later comparison.

For the front end framework, I want it to be in plain html/js. For the backend, I want it to be [Node.JS](#). For the AI model, I would like it to be either OpenAI or ClaudeAI. The database for storing college data, I also would like to create that. With that being said, I am new to coding and do not have much experience so I would like you to use whatever is best for this as you will be able to handle these decisions and ideas better than I would be able to.

This recommendation section is going to include both 4 year universities and also community colleges. These are only going to include accredited institutions and located in the United States.

Some extra things I would like to mention is to add a university link next to the college that is recommended for the user to be able to access. This can be a general university page. I also want to add a link with that school as well that brings them to a scholarship page of that university. On top of this, after giving the top 5 school recommendations, I want to give some honorable mentions (without links) that also match some of their preferences. I also want to add a small 2-3 sentence summary that tells them why the school is great for them.

First thing, just to start and see how it works, lets just start off with simple answers instead of the great, alright, bad thing. We can fix that later. Second thing, I do like the structure of what you made so far and it is really good. After we build it and I use it, I can look at it and make changes after that. Also, can you build the database for me for AI to interact with for recommendations? Besides those things mentioned above, I would like you to start building everything and let me know what to do from there.

How do I add my api key? When I input the link to my browser, it only comes up with results that do not match the link. Also, when I start the server and click on the "results" link, it takes me to the link but it gives me an error saying "No session ID provided". Also, I would like you to add all accredited colleges and universities in the United States to the database. I am not sure how you would get this but I would like you to do that any way you can. I also would like you to increase the weight percentage on Location and

Major if you can. I believe that is more important than some of the other variables. Let's start with that and go from there.

Sorry, before you keep going, if you can add my api key where applicable, my api key is "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". Also, I want the location of the university to be set based off where the user lives so that the agent calculate "miles away from home" and can help sort out in/out of state tuition costs as they go hand in hand. Do you get what I am saying?
